

SeaWave origin and travel

Client-verified 18 August 2026 (Europe/Berlin). Live FantaTennis vs local JFTSE. Branch test/wave-origin-directions on ThewindMom/JFTSE, based on development 568fc3ec (matches sstokic-tgm/JFTSE development).

Answer

xyz places the drop. After that it is not a missile. Every SeaWave is a full-width foam band (crest already spans sideline to sideline) and it only travels along the court, baseline to net. No heading field. Left-to-right travel is not possible. Waves from behind the player still hit if the band passes through the character.

Packet

```
S2CMatchplayUseSkill(attacker, target, skillId, seed, x, z, y)
skillId 27 = SeaWave (Skill table id 28)
attacker 4 = dummy slot (no guardian mesh). Dummy 5 also works.
knockback baked (0, 0, 150) along court length.
Court xyz forwarded from the client, no extra server scale.
No direction argument. xyz only moves the ground drop.
```

How it was tested

Command -wavetest in a Guardian match on Nest of Rubycrab. Nine SeaWaves, 5 seconds apart, labeled in chat. Account test / Testmon. HP padded at intro end so a level-1 character survived. Complete run reached WAVE 9/9, Testmon alive at 01:12.

The nine drops

Wave	Attacker	xyz (x, z, y)	Intent
1/9	4	(0, 0, 0)	net / court origin
2/9	4	(-150, 0, 0)	-X sideline
3/9	4	(150, 0, 0)	+X sideline
4/9	4	(0, 0, -150)	-Y baseline (player half)
5/9	4	(0, 0, 150)	+Y baseline (opponent half)
6/9	4	(0, -150, 0)	-Z axis
7/9	4	(0, 150, 0)	+Z axis
8/9	5	(0, 0, 0)	dummy slot 5, origin 0
9/9	4	(-150, 0, 150)	corner -X / +Y

What the client did

- (0,0,0) is net-center, not under the player.
- +Y is the opponent / far baseline. -Y is the player / near baseline.
- +/-X moves the drop toward a sideline. That is the lane axis.
- +/-Z still produced a full-width wall. Z is not a useful heading.
- Travel never changed. Always baseline to net.
- Knockback stays (0, 0, 150) along that axis.
- WAVE 1 came from behind Testmon and popped 9708. WAVE 4 sat on the near baseline and popped 9042. Facing does not matter.
- HP bar stayed 200/200 because of the pad. Popups are real hits (9000+).

For Atlantis herding

Do not spawn at the net and hope the wave comes at the players. Drop on the player half (-Y) with +/-X offsets so parallel bands sweep toward the net and leave corridors. Dummy 4 is fine. Anyone in a band takes damage, including from behind. Ground-placed herding, not a steered missile.

Not possible

- Steering a SeaWave after it lands.
- Left-to-right travel as the motion axis.
- Per-wave knockback direction. It stays (0, 0, 150).
- Using Z as a travel axis.

Test harness (this branch only)

wavetest.js fires the 9 drops in a guardian match. In the waiting room it writes /tmp/jftse-wavetest.arm and the volley starts after the intro. HP pad iterates ConcurrentLinkedDeque (not .get(i)) and sends S2CMatchplayDealDamage heal skill 1 with HP 30000 (client HP is a short).

3_wavetest_autopad.js pads HP on MP_GAME_ANIM_SKIP_END before GuardianAttackTask, then fires an armed volley. Solo Testmon otherwise dies in about 15s. These scripts do not replace guardian-phase/10.

Still wave1

WAVE 1/9 xyz=(0,0,0) net origin. Band comes from behind Testmon. Hit popup 9708.

Still wave3

WAVE 3/9 xyz=(150,0,0) +X sideline. Spawn offset only. Travel still along the court.

Still wave6

WAVE 6/9 xyz=(0,-150,0) -Z. Full-width band at the net, still baseline-to-net travel.

Still wave9

WAVE 9/9 xyz=(-150,0,150) corner. Last shot of the complete 9-wave run.
